

# THE SPACE PLATFORM

by

Dogeroid

Built Using the In-House Developed

*Super Breakthrough Blockchain Technology (SBBT)*

Given that a blockchain is a series of connected recorded entries that are visible to all who participate, unchangeable by anyone or anything and is completely decentralized with no intermediaries, it is the perfect solution to the concept of one Space community where a coordinated and collaborative platform will open up new frontiers, new economic opportunities and new financing for ventures.

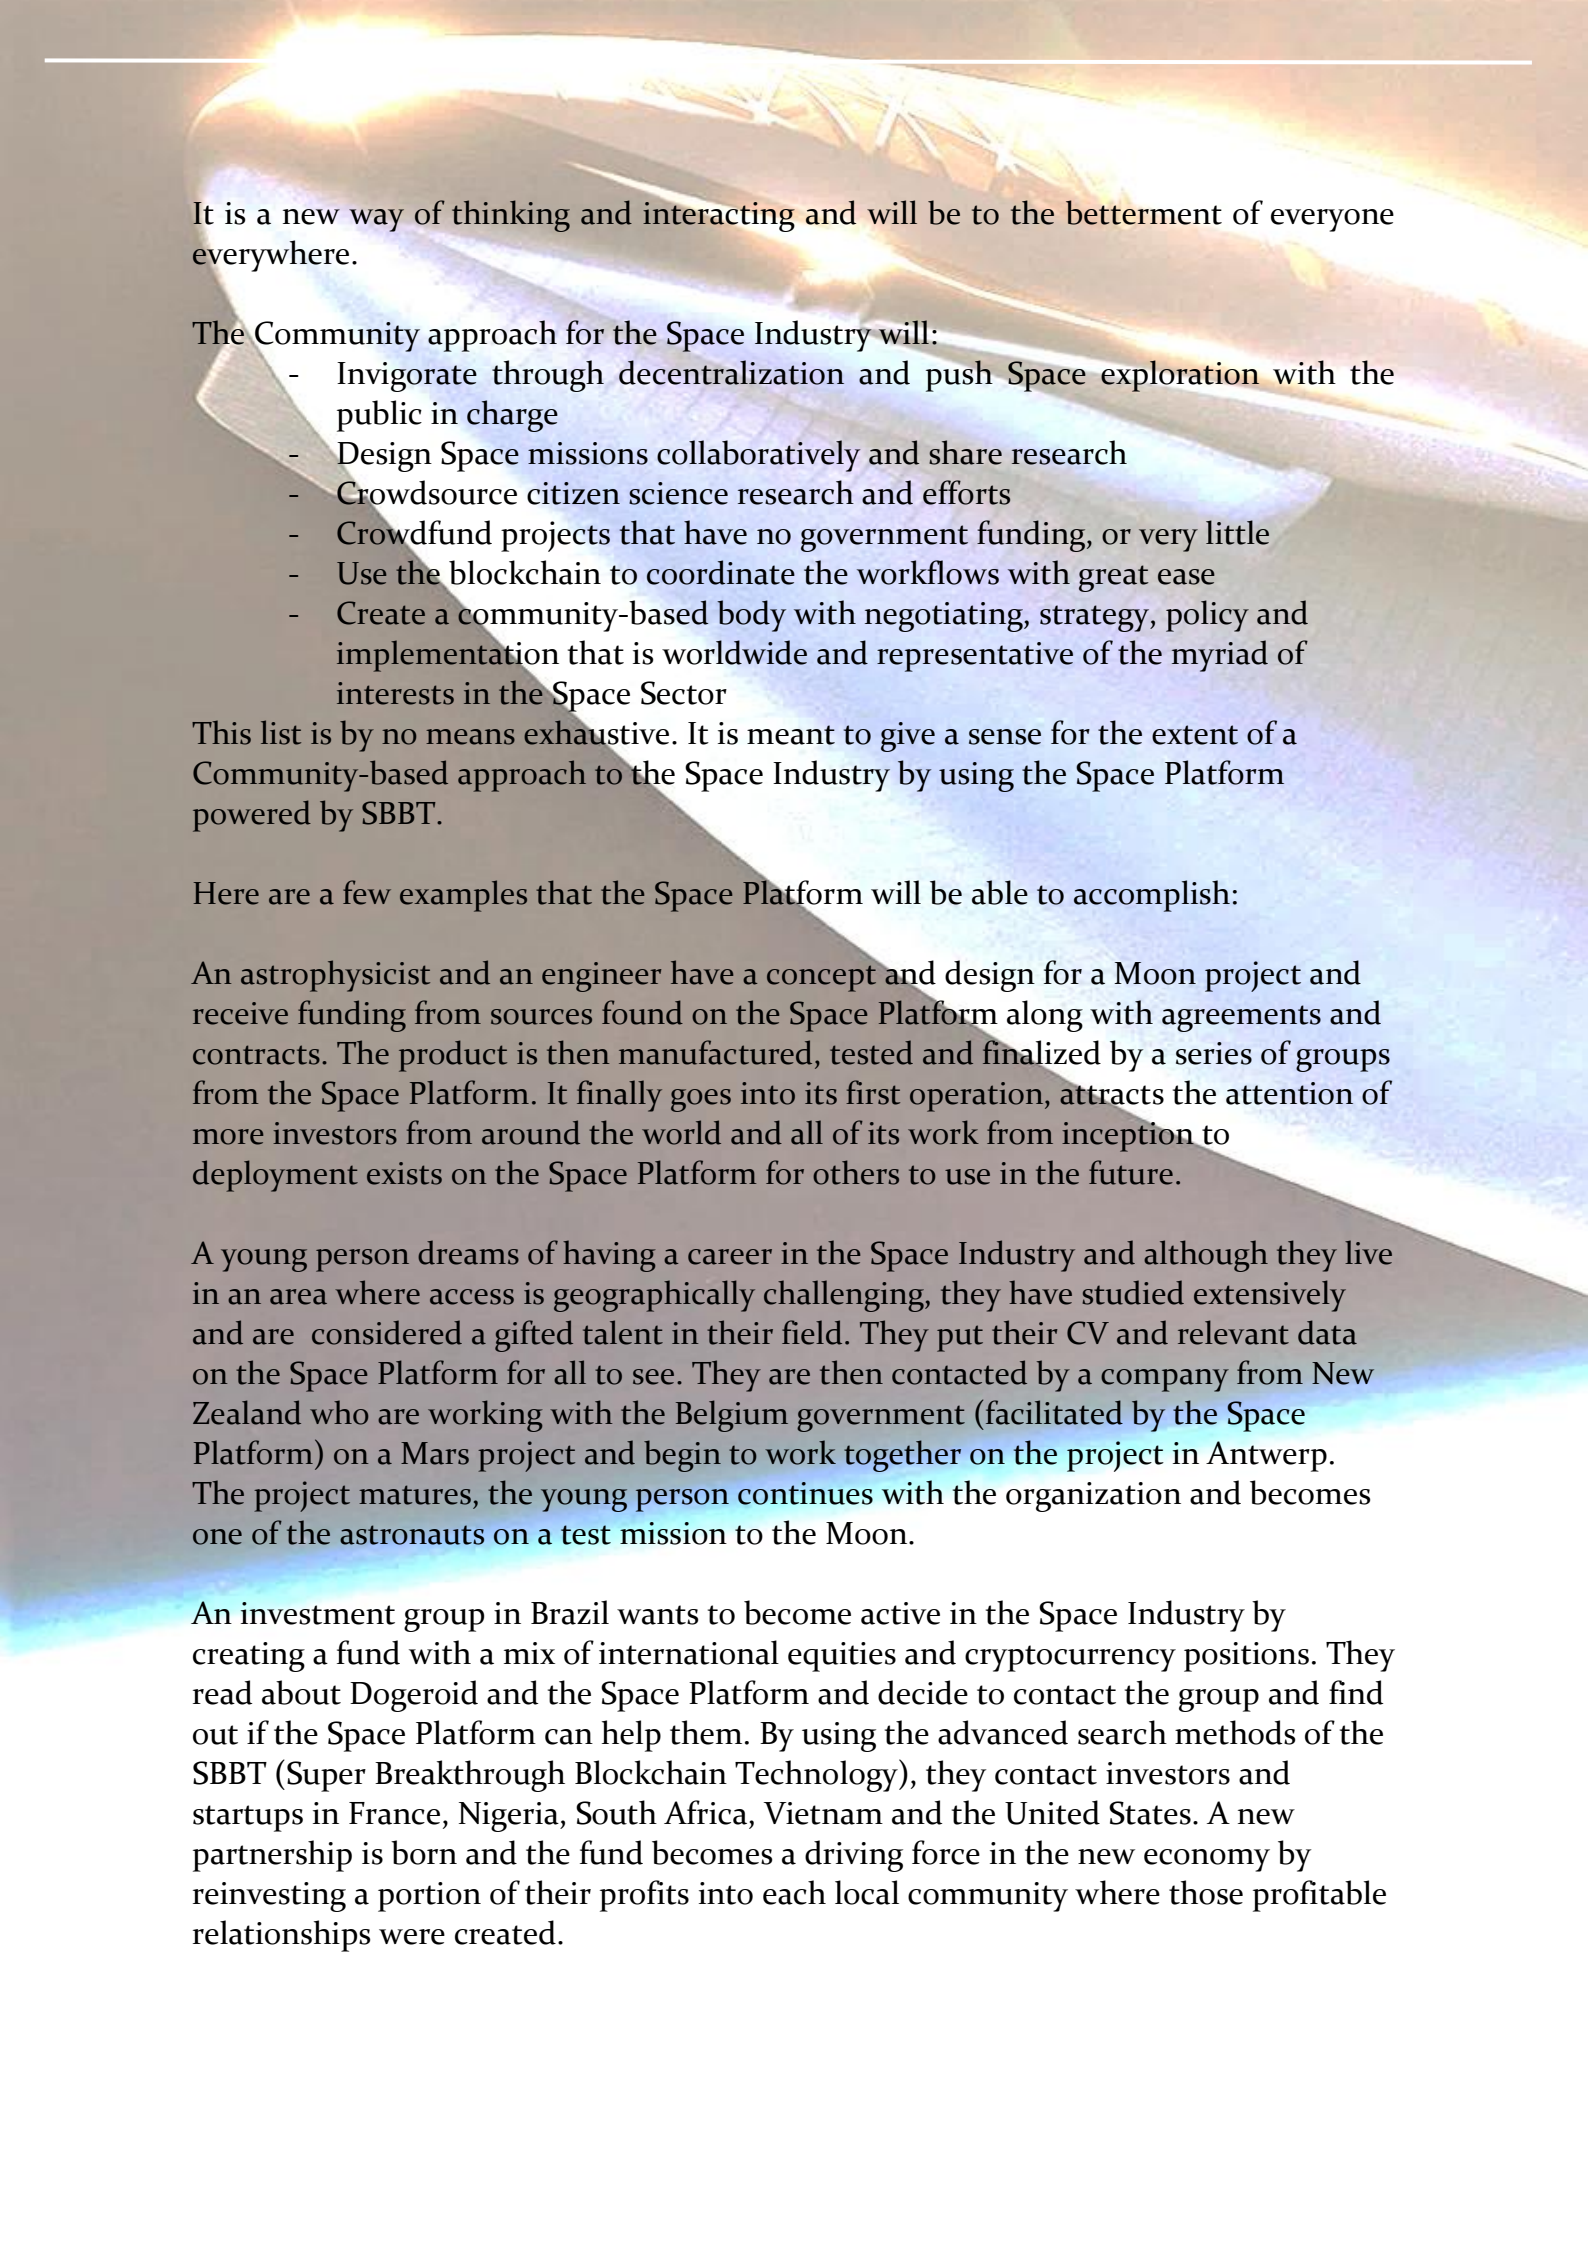

The Space Platform will be designed exactly for this purpose. Such a massive undertaking will be created using Dogeroid's own SBBT proprietary system that will connect all actors in the Space sector to one another, without a central and controlling hub.

All participants will have the facility to enter and retrieve space related data for; projects, collaborations, financing needs and availabilities, collaborations, transversal team concepts, inventions, ideas and job and talent searches so that Space related contact, search and offerings will be available at all times around the world to anyone with an internet connection.

All in one blockchain using our proprietary SBBT that will allow person to person, person to group, person to financing sources, person to government, group to financing sources, group to governments, group to group, government to government, financing to all, and vice-versa.

This is what is meant by Community Based; a non-centralized series of self-created groups from around the world to collaborate and create a multitude of activities that develop their own eco-systems and can work with other individuals and eco-systems at will. The only constraints are those of transparency, trust and having every event and action recorded in the blockchain as evidence of activity. This is a new way of thinking and will require an understanding of self-responsibility and accountability as time goes forward.

The Space Platform will compete with existing companies who are independent along with markets and economies, coordinating its activities as an extremely large and agile player. Over time, larger players will join the Space Platform after realizing it is not competitive and it has no desire to acquire their existence. Quite the contrary, it will be independent from their ownership but collaborate and coordinate, just as a community is comprised by many individuals with their own self-interest at heart.

It is a new way of thinking and interacting and will be to the betterment of everyone everywhere.

The Community approach for the Space Industry will:

- Invigorate through decentralization and push Space exploration with the public in charge
- Design Space missions collaboratively and share research
- Crowdsource citizen science research and efforts
- Crowdfund projects that have no government funding, or very little
- Use the blockchain to coordinate the workflows with great ease
- Create a community-based body with negotiating, strategy, policy and implementation that is worldwide and representative of the myriad of interests in the Space Sector

This list is by no means exhaustive. It is meant to give a sense for the extent of a Community-based approach to the Space Industry by using the Space Platform powered by SBBT.

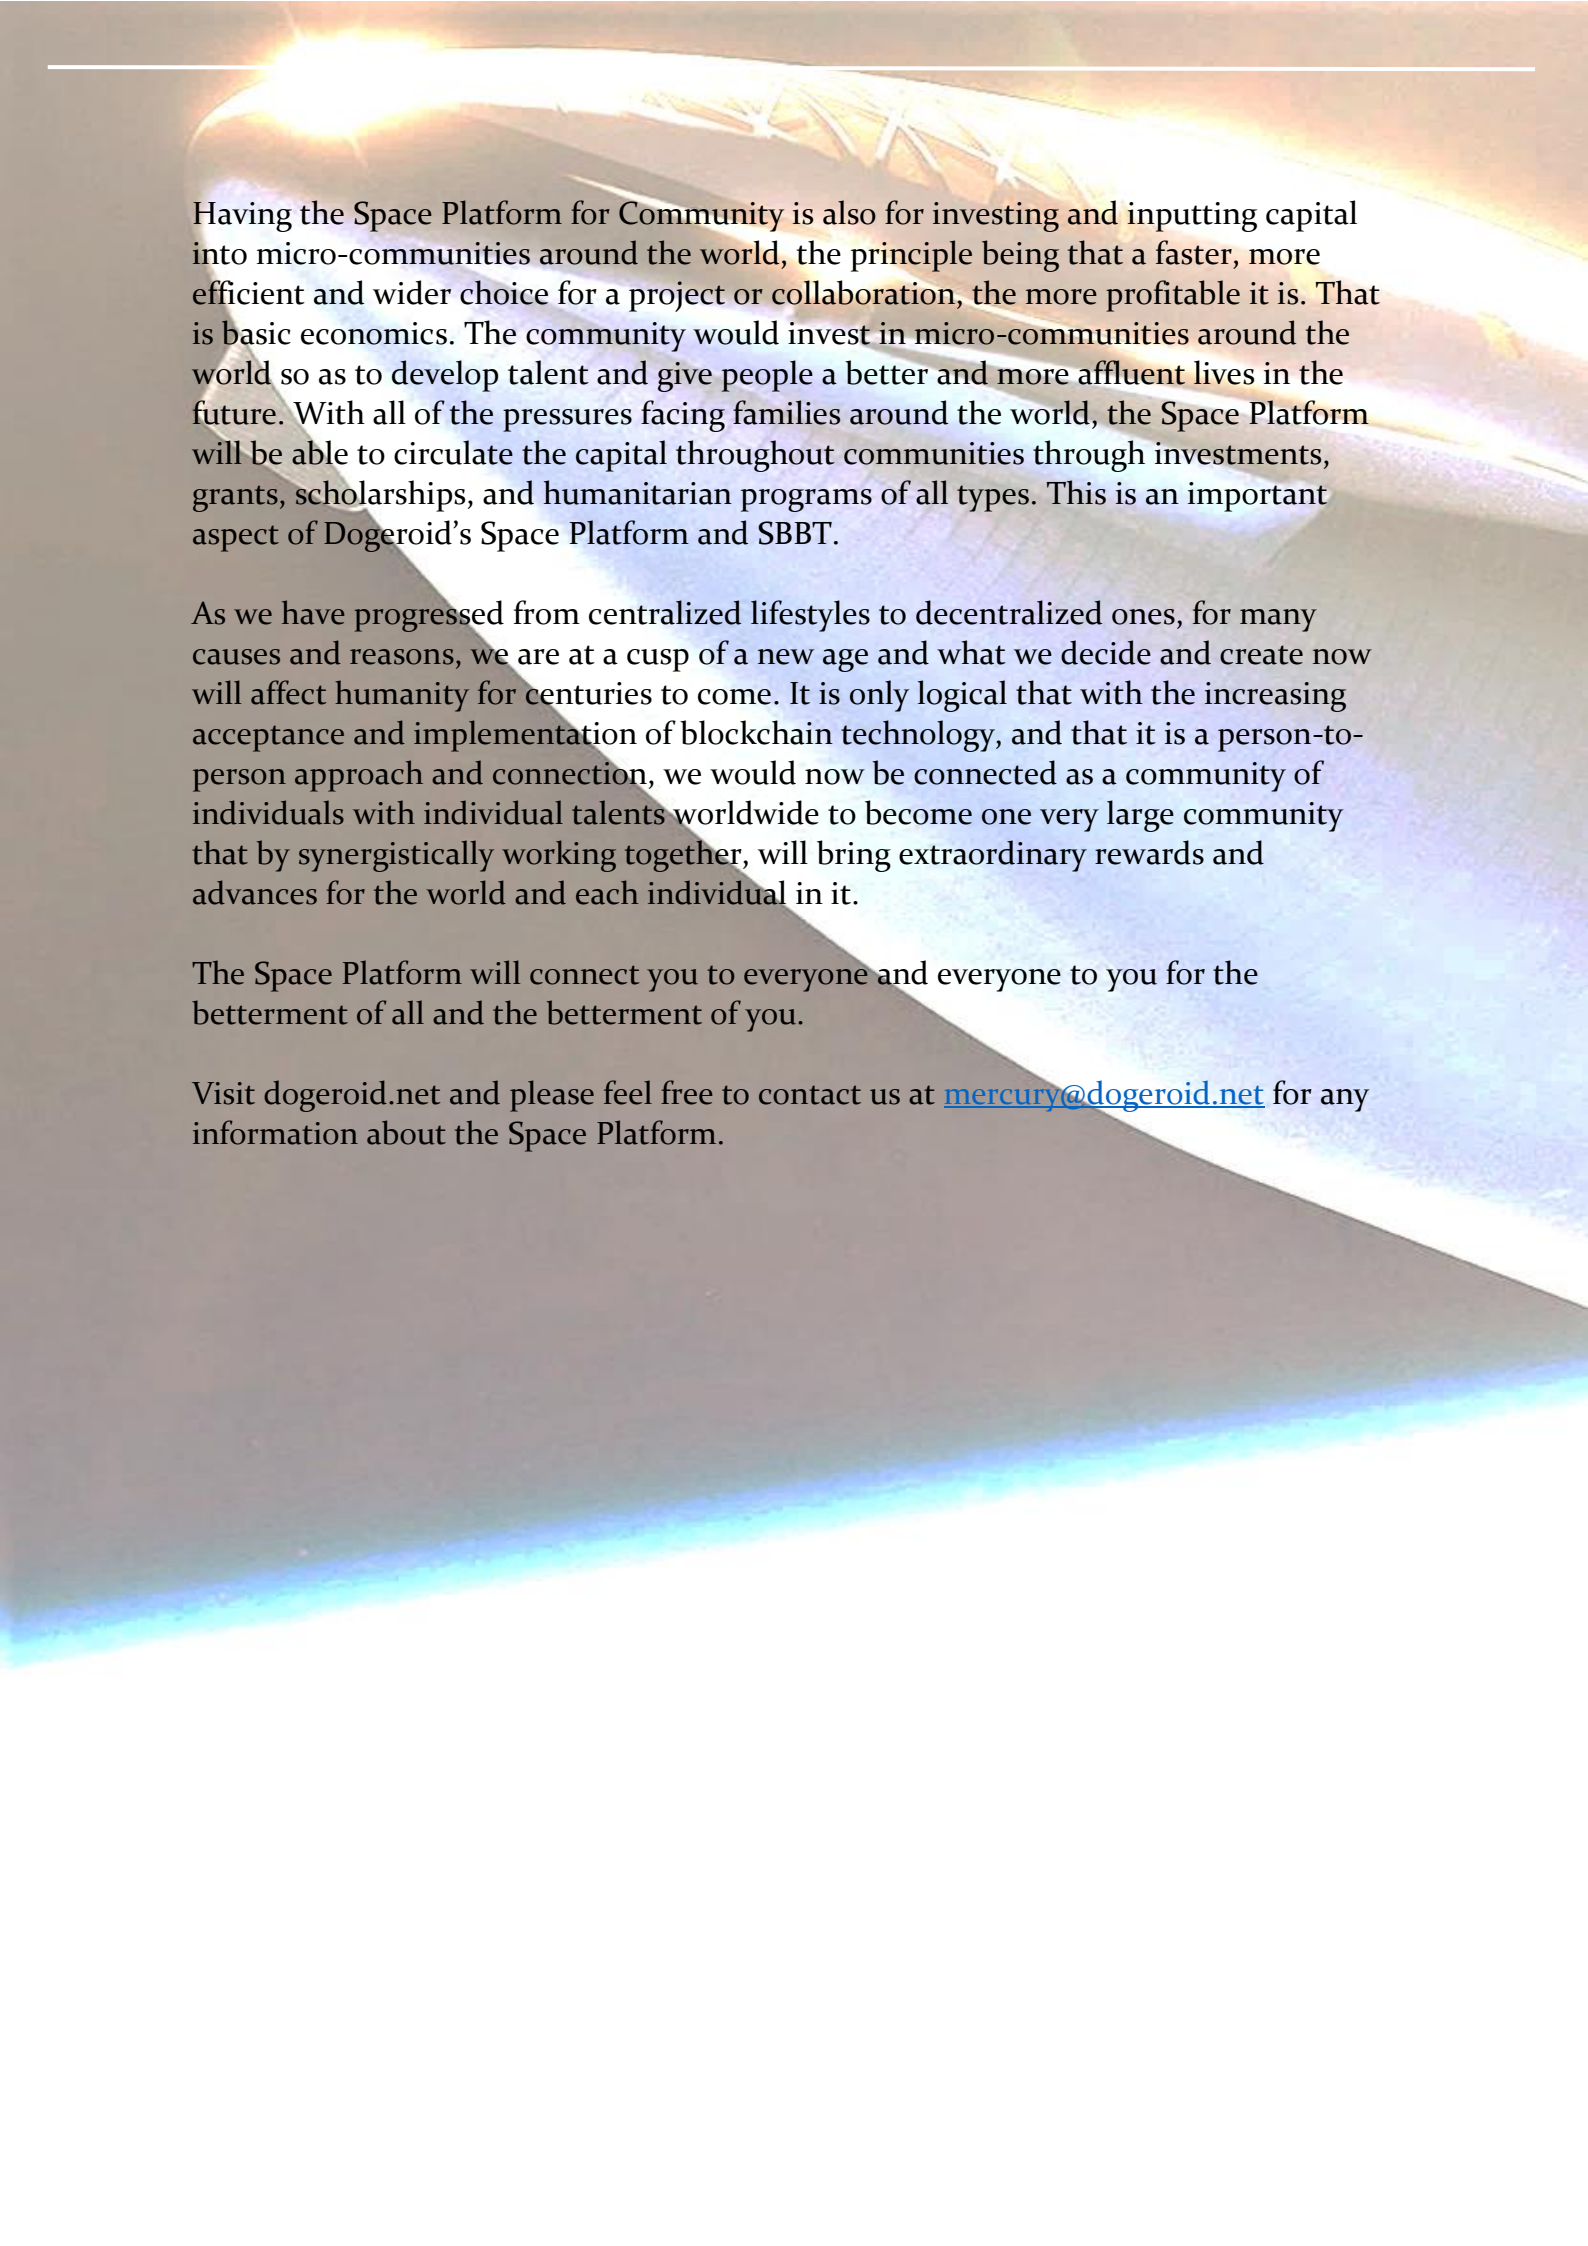

Here are a few examples that the Space Platform will be able to accomplish:

An astrophysicist and an engineer have a concept and design for a Moon project and receive funding from sources found on the Space Platform along with agreements and contracts. The product is then manufactured, tested and finalized by a series of groups from the Space Platform. It finally goes into its first operation, attracts the attention of more investors from around the world and all of its work from inception to deployment exists on the Space Platform for others to use in the future.

A young person dreams of having a career in the Space Industry and although they live in an area where access is geographically challenging, they have studied extensively and are considered a gifted talent in their field. They put their CV and relevant data on the Space Platform for all to see. They are then contacted by a company from New Zealand who are working with the Belgium government (facilitated by the Space Platform) on a Mars project and begin to work together on the project in Antwerp. The project matures, the young person continues with the organization and becomes one of the astronauts on a test mission to the Moon.

An investment group in Brazil wants to become active in the Space Industry by creating a fund with a mix of international equities and cryptocurrency positions. They read about Dogeroid and the Space Platform and decide to contact the group and find out if the Space Platform can help them. By using the advanced search methods of the SBBT (Super Breakthrough Blockchain Technology), they contact investors and startups in France, Nigeria, South Africa, Vietnam and the United States. A new partnership is born and the fund becomes a driving force in the new economy by reinvesting a portion of their profits into each local community where those profitable relationships were created.

Having the Space Platform for Community is also for investing and inputting capital into micro-communities around the world, the principle being that a faster, more efficient and wider choice for a project or collaboration, the more profitable it is. That is basic economics. The community would invest in micro-communities around the world so as to develop talent and give people a better and more affluent lives in the future. With all of the pressures facing families around the world, the Space Platform will be able to circulate the capital throughout communities through investments, grants, scholarships, and humanitarian programs of all types. This is an important aspect of Dogeroid's Space Platform and SBBT.

As we have progressed from centralized lifestyles to decentralized ones, for many causes and reasons, we are at a cusp of a new age and what we decide and create now will affect humanity for centuries to come. It is only logical that with the increasing acceptance and implementation of blockchain technology, and that it is a person-to-person approach and connection, we would now be connected as a community of individuals with individual talents worldwide to become one very large community that by synergistically working together, will bring extraordinary rewards and advances for the world and each individual in it.

The Space Platform will connect you to everyone and everyone to you for the betterment of all and the betterment of you.
